

PRODUCT BRIEF

QNX Neutrino[®] Realtime Operating System

QNX Neutrino® is a full-featured and robust operating system designed to enable the next-generation of products for automotive, medical and industrial embedded systems. Microkernel design and modular architecture enable customers to create highly optimized and reliable systems with low total cost of ownership. With QNX Neutrino®, embedded systems designers can create compelling, safe and secure devices built on a highly reliable operating system software foundation that helps guard against system malfunctions, malware and cyber security breaches.

For over 35 years, thousands of companies have deployed and trusted QNX realtime technology to ensure the best combination of performance, security and reliability in the world's most mission-critical systems.

[Built-in mission critical reliability](#)

Time-tested and field-proven, the QNX Neutrino® is built on a true microkernel architecture. Under this system, every driver, application, protocol stack, and filesystem runs outside the kernel in the safety of memory-protected user space. Virtually any component can fail and be automatically restarted without affecting other components or the kernel. No other commercial RTOS provides such a high level of fault containment and recovery.

Inherently modular, QNX Neutrino lets you dynamically upgrade modules, introduce new features, or deploy bug fixes — without costly downtime or system outages.

[Deliver devices with modern, compelling user interfaces](#)

HMI technologies change fast. If your platform doesn't keep up, you may be stranded with outdated and unsupported software. QNX Neutrino® has a hardware optimized composition manager that enables the creation of a single unified interface from multiple HMI frameworks. Its universal application interface has the ability to easily integrate graphics and HMI technologies such as HTML5, Kanzi, OpenGL ES, Qt 5, Storyboard, video, and other 3rd party HMI frameworks.

[Built-in safety and security](#)

QNX Neutrino® provides a comprehensive system approach to security, designed to help you easily build impenetrable systems. Security policy is described in a central policy repository, which allows system architects and integrators to determine, and configure the optimal security level for their system. Security is achieved by layering different optional security mechanisms including secure boot, integrity measurement, sandboxing, access controls (mandatory or discretionary) and rootless execution. The solution also provides the ability to audit and attest to the integrity of the system.

The QNX Neutrino microkernel memory-protected architecture provides a foundation to build safety-critical systems. QNX Neutrino® is 100% API compatible with QNX pre-certified software products that address compliance with safety certifications in automotive (ISO 26262), industrial safety (IEC 61508) and medical devices (IEC 62304).

[Maximize software investments](#)

QNX Neutrino® provides a common software platform that can be deployed for safety certified and non-certified projects across a broad range of hardware platforms. Organizations can reduce duplication, costs and risks associated with the deployment of different OS/Tools variants across projects.

Developers can ramp up quickly because QNX Neutrino® looks and feels like Unix and provides a familiar open standards based development environment. Develop using C/C++, HTML5, Qt, Python, etc. Port legacy and open-source UNIX, Linux, and other source code over easily as QNX Neutrino® is certified POSIX compliant.

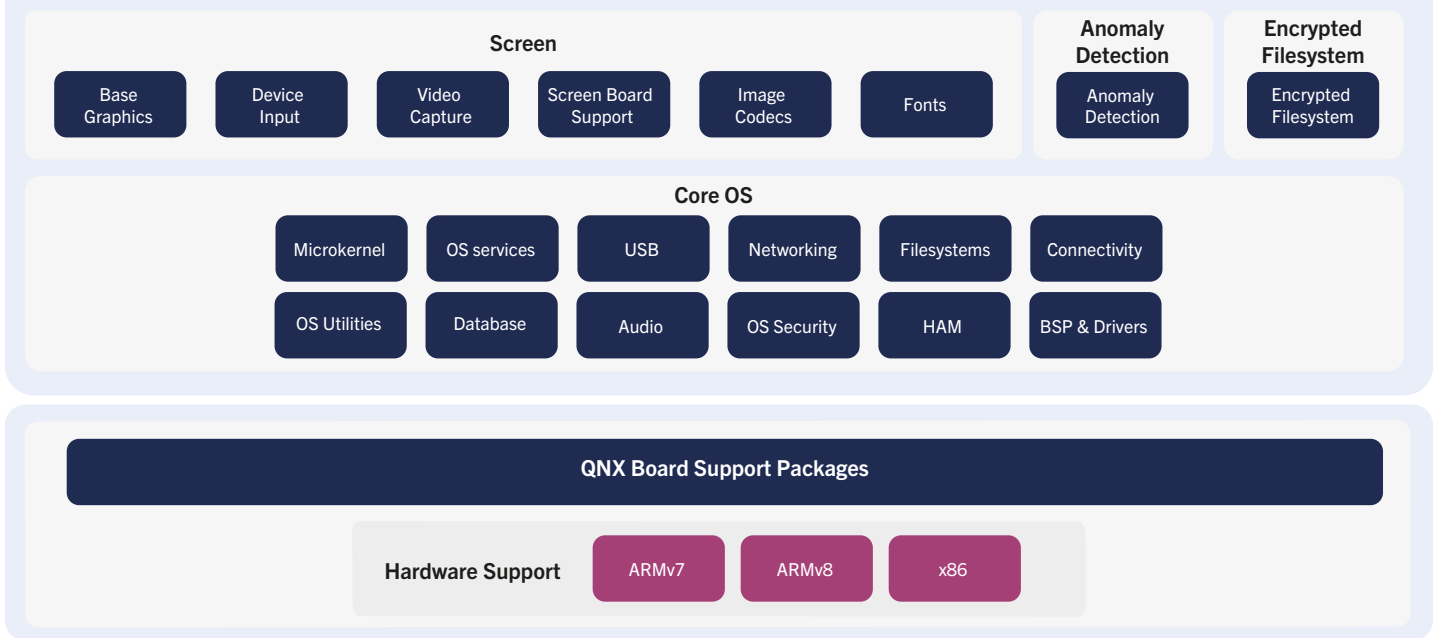

[Broad Silicon Support](#)

Choose from a broad selection of board support packages for select AMD, Intel, NVIDIA, NXP, Qualcomm, Renesas, Samsung, TI and Xilinx SoCs. Leverage industry leading GPU support for your applications based on ARM Mali, Imagination PowerVR, Intel HD, NVidia CUDA, Qualcomm Adreno and VeriSilicon Vivante.

[QNX Software Center](#)

The QNX Software Center provides a secure, centralized repository for discovery, delivery and installation of all QNX software. QNX developers are pro-actively alerted when security updates, patches and product updates are available and can easily manage dependencies, software baselines and licensing compliance.
